

How To Clean Your Vacuum Cleaner?

Your vacuum cleaner does a lot of work around the house to keep it clean for you. For best performance, have your vacuum cleaner regularly serviced by a local repair shop or opt for the annual maintenance services offered by the seller. This will not only extend the life of your machine, but all make your cleaning routine more effective and efficient.

Clean The Brush

- Depending on how much the vacuum cleaner is used, the brush should be regularly cleaned.
- Unlatch the brush and remove the particles and debris from its bristles. Use a pair of scissors to cut away any unwanted fabric, debris or hair caught in the brush. Check the bearings and belts for any damage and clean around the ends of the brush too.
- To achieve a thorough cleaning, the brush can also be washed with warm water and a mild detergent. However, ensure that the brush is completely dry before attaching it to the vacuum cleaner.

Check The Filters

- Clogged filters cause loss of suction and can damage the motor of the vacuum cleaner. The pre-filter should be cleaned whenever there is a visible accumulation of debris and dust on it. The HEPA filter should be cleaned after four to six uses.
- To clean the filters remove them and shake them out. If the filter is made of foam you can even rinse it with water.
- If a filter is worn out or damaged, it should be replaced. The HEPA filter should be replaced once every six months.

Check The Hose

- If your vacuum cleaner isn't picking up dirt, it could be that the vacuum hose is clogged.
- Detach the hose from the vacuum and shove a broom handle through the opening. This will push any debris out and unclog the hose.
- A bent electric wire or coat hanger can also be used to clean the hose. However, it is advisable to exercise a little caution while using this technique since it might puncture the hose.
- The hose can also be cleaned by rinsing it with water.
